EXPERIMENT 10

PERFORMANCE OPTIMIZATION IN ZOHO CREATOR

Project: StudyLens – AI Learning Gap Analyzer

Aim

To review performance and usability of the StudyLens application.

Introduction

Optimization aims to make forms, reports, and pages easier to use and records easier to retrieve.

Procedure

- Review the Students form and remove fields not needed for the current workflow.
- Use clear field labels and sensible dropdown choices.
- Configure reports to show only relevant columns.
- Use search and filters for available student fields.
- Review workflows for repeated or unnecessary operations.
- Test with multiple records and note actual loading and search behaviour.

Measurement

Record loading or search time before and after a change if claiming a measurable improvement. Do not claim a speed improvement without measurement.

Prototype Note

The screenshot shows the StudyLens Students form. Report filters and workflows are configuration steps unless verified in the current app.

Result

A StudyLens optimization checklist was prepared; performance claims require actual test results.
