EXPERIMENT 6

WORKFLOWS IN ZOHO CREATOR

Project: StudyLens – AI Learning Gap Analyzer

Aim

To understand and design workflow automation in Zoho Creator for StudyLens, including form validation, record handling, notifications, and a learning-progress process that can support the identification of student learning gaps.

Application and Platform

Application: StudyLens – AI Learning Gap Analyzer

Platform: Zoho Creator (low-code application builder)

Overview

StudyLens is designed to maintain student profiles, subjects, topics, assessments, assessment results, and study plans. Workflows can validate data when a record is submitted, keep related records consistent, and notify the relevant user when an important action occurs. The screenshots in this document show the available StudyLens prototype forms and reports. They do not imply that every proposed automation has already been configured.

Workflow 1 – Validate Student Details

Trigger: When a student record is submitted in the Students form.

- Check that the student name and required profile fields are not empty.
- Validate the email field format before accepting the record.
- If the details are invalid, display a clear message and prevent the record from being saved; otherwise, save the student profile.

Suggested Deluge-style logic (field names may need to be adjusted to match the exact Zoho Creator field link names):

```
if(input.Email != null && !input.Email.matches("^[A-Za-z0-9+_.-]+@[A-Za-z0-9.-]+$"))
{
    alert "Enter a valid email address.";
    cancel submit;
}
```

Workflow 2 – Assessment Result Validation

Trigger: When an Assessment Results record is submitted.

- Confirm that the linked assessment and student are selected.
- Check that marks obtained are numeric and are not negative.
- If total marks are available from the linked assessment, ensure marks obtained do not exceed the total marks.
- Save valid results so they can be reviewed in reports and used for later learning-gap analysis.

This is a recommended workflow. Configure it only after the assessment and result fields are linked correctly using Zoho Creator lookup fields.

Workflow 3 – Learning Gap Follow-up

Proposed process: After an assessment result is saved, review the score and the student's reported difficulty for the associated topic. If performance is below a threshold selected by the institution, create or recommend a Study Plan task for that topic. The threshold and task-generation logic should be defined before implementation; this workflow is a design proposal unless it has been separately configured.

Workflow 4 – Notifications and Reports

- A confirmation email can be sent after a student profile or assessment result is successfully submitted, if email notifications are enabled and the recipient address is available.
- Reports such as All Students, All Assessments, and All Assessment Results can be used to review saved records and identify incomplete or low-scoring entries.
- A future dashboard may summarize average performance, difficult topics, and pending study-plan tasks. Dashboard calculations should use actual saved data rather than mock values.

Screenshots of the StudyLens Zoho Creator Prototype

The following figures document the forms and reports available in the captured prototype. The Zoho interface showed a trial-expired notice in the screenshots, so this document describes the prototype and its intended workflows rather than claiming that the application is currently deployed or that all automations are active.

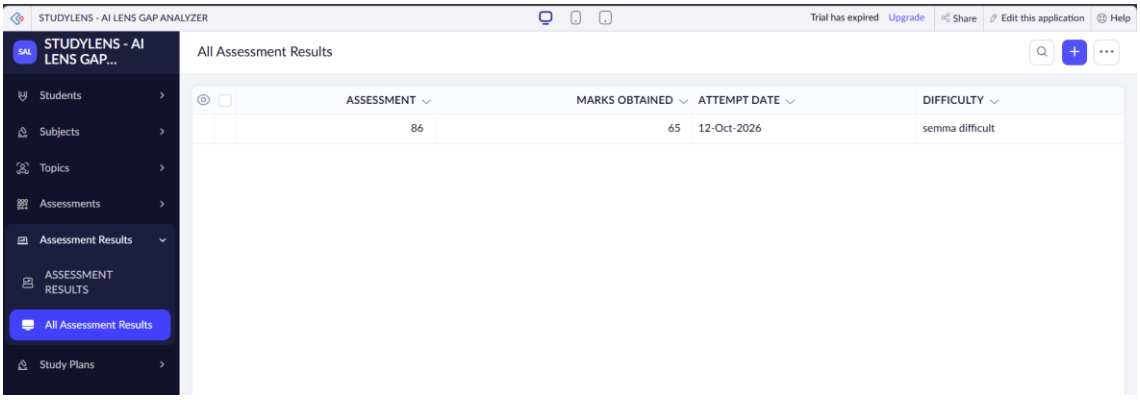

Figure 5. Assessment Results report

Result

The StudyLens workflow design defines how student details and assessment results can be validated, how saved records can support learning-gap follow-up, and how notifications and reports can assist review. The included screenshots provide evidence of the current forms and reports. Validation rules, automatic study-plan creation, email notifications, and dashboard calculations should be marked as completed only after they are configured and tested in Zoho Creator.
