EXPERIMENT 8

USER ACCESS AND DATA SECURITY

Project: StudyLens – AI Learning Gap Analyzer

Aim

To plan access control and data protection for StudyLens in Zoho Creator.

Introduction

StudyLens stores student profiles and may later include subjects, topics, assessments, assessment results, and study plans. Personal and academic information should be visible only to authorized users.

Access-Control Plan

- Administrator: manage application configuration, forms, fields, and permissions.
- Faculty or mentor: review assigned student records and assessment summaries when permitted.
- Student: access only their own profile, results, and study-plan information after user-specific access is configured.
- Public users: should not access private student records.

Security Checks

- Require authentication for private records.
- Grant only permissions needed for each role.
- Review sharing settings for forms, reports, and pages.
- Test with separate accounts to confirm users cannot view or edit unauthorized records.
- Never place passwords, tokens, or sensitive student data in public documentation.

StudyLens Application

The supplied screenshot shows the StudyLens Students form. Role-based permissions are recommended configuration steps; the screenshot alone does not prove that separate roles have been configured.

Result

A role-based security plan was prepared. Verify actual access restrictions in Zoho Creator with test users before sharing the application.
