EXPERIMENT 9

APPLICATION TESTING AND VALIDATION

Project: StudyLens – AI Learning Gap Analyzer

Aim

To prepare a testing procedure for StudyLens in Zoho Creator.

Introduction

Testing checks whether forms accept valid data, reject invalid entries where validation is configured, and display saved records correctly.

Test Cases

- Submit a student profile with required fields completed.
- Check how the form handles a missing required field.
- Enter a malformed email address and verify configured validation.
- Save a valid student record and confirm it appears in the relevant report.
- Check dropdown choices and confirm selected values are saved.
- When assessment forms are available, test negative marks and marks above the total.
- Test permissions with separate accounts if roles are configured.

Testing Record

For each test, record the input, expected result, actual result, and Pass/Fail status. Do not mark a test as passed until it has been run.

Prototype Note

The screenshot documents the Students form. Test subjects, topics, assessments, results, and study plans only after those forms are available.

Result

A validation checklist was prepared. Update the result with observed Pass/Fail outcomes after testing.
